Searon Notes

Dear Examiner Li,

See attached results.

If you have any questions about this search feel free to contact me at any time.

Thank you for using STIC search services!

Mary Hale, Information Branch Supervisor Remsen Bldg. 01 D86 571-272-2507

>	I am an examiner in Workgroup: Example: 1610
. >	Relevant prior art found, search results used as follows:
	☐ 102 rejection
•	☐ 103 rejection
	☐ Cited as being of interest.
	Helped examiner better understand the invention.
·	☐ Helped examiner better understand the state of the art in their technology.
	Types of relevant prior art found:
	☐ Foreign Patent(s)
	□ Non-Patent Literature (journal articles, conference proceedings, new product announcements etc.)
>	Relevant prior art not found:
	Results verified the lack of relevant prior art (helped determine natentability)

able means was the collection of the collection

Results were not useful in determining patentability or understanding the invention.

The method is useful for immunizing an individual against infection by vaccinia and/or variola virus. This sequence represents a vaccinia virus peptide used in the method of the invention.

The invention relates to a new avipoxvirus comprising in the viral genome, a Vaccinia virus host range gene or a homologue of the host range gene, provided that the host range gene is not the B31 gene if the avipoxvirus is a recombinant Canary poxvirus comprising in the viral genome the Vaccinia virus K31 gene as well as expression cassettes for HIV gag-pro, gp120/TM and a Nef/Pol poly-epitope string, respectively. The composition or the vaccine is useful as a drug for affecting, preferably inducing immunological response in a living animal, including a human. The Vaccinia wirus host range gene or its homologue, preferably a human. The variance lister infection of the variance is useful to increase the titer of avipoxviruses a vaccine is useful to increase the citer of avipoxviruses a vaccine is useful to increase the citer of avipoxviruses a vaccine is a vaccine avignovirus, where the host range gene is expressed in the cells. The current sequence represents the amino acid sequence encoded by the C7L
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

The invention relates to a method of immunizing an individual against infection by vaccinia and/or variola virus by inducing an immune response against a polypeptide comprising peptide 74A or 165, or its immunogenic fragments or mutants. The method is useful for immunizing an individual against infection by vaccinia and/or variola virus. This sequence represents a vaccinia virus peptide used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a method of immunizing an individual against infection by vaccinta and/or variola virus by inducing an immune response against a polypeptide comprising peptide 74A or 165, or its immunogenic fragments or mutants. The method is useful for immunizing an individual against infection by vaccinia and/or variola virus. This sequence
                                                                                                                                                                                           Immunizing an individual against infection by vaccinia and/or variola virus comprises inducing an immune response against a polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Immunizing an individual against infection by vaccinia and/or variola
virus comprises inducing an immune response against a polypeptide
comprising peptide 74A or 165.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          virucide; vaccine; immunisation; vaccinia; variola; immune response.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a method of immunizing an individual against infection by vaccinia and/or variola virus by inducing an immune response against a polypeptide comprising peptide 74A or 165, or its immunogenic fragments or mutants. The method is useful for immunizing an individual against infection by vaccinia and/or variola virus. This sequence represents a vaccinia virus peptide used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Immunizing an individual against infection by vaccinia and/or variola virus comprises inducing an immune response against a polypeptide comprising peptide 74A or 165.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a method of immunizing an individual against infection by vaccinia and/or variola virus by inducing an immune response against a polypeptide comprising peptide 74A or 165, or its immunogenic fragments or mutants. The method is useful for immunizing an individual against infection by vaccinia and/or variola virus. This sequence represents a vaccinia virus peptide used in the method of the invention.
represents a vaccinia virus peptide used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                    Immunizing an individual against infection by vaccinia and/or variola
virus comprises inducing an immune response against a polypeptide
comprising peptide 74A or 165.

The invention relates to a method of immunizing an individual against infection by vaccinia and/or variola virus by inducing an immune response against a polypeptide comprising peptide 74A or 165, or its immunogenic fragments or mutants. The method is useful for immunizing an individual against infection by vaccinia and/or variola virus. This sequence represents a vaccinia virus peptide used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Immunizing an individual against infection by vaccinia and/or variola virus comprises inducing an immune response against a polypeptide comprising peptide 74A or 165.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Immunizing an individual against infection by vaccinia and/or variola
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 # X D X # X 8 X X X E X H X Y X
                                                                                                                                                                                ö
                                                             infection by vaccinia and/or variola virus by inducing an immune response against a polypeptide comprising peptide 74A or 165, or its immunogenic fragments or mutants. The method is useful for immunising an individual against infection by vaccinia and/or variola virus. This sequence represents a vaccinia virus peptide used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a method of immunizing an individual against infection by vaccinia and/or variola virus by inducing an immune response against a polypeptide comprising peptide 74A or 165, or its immunogenic fragments or mutants. The method is useful for immunizing an individual against infection by vaccinia and/or variola virus. This sequence represents a vaccinia virus peptide used in the method of the invention.
                                                     invention relates to a method of immunizing an individual against
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Immunizing an individual against infection by vaccinia and/or variola virus comprises inducing an immune response against a polypeptide comprising peptide 74A or 165.
                                                                                                                                                                                  Gaps

```
The invention relates to a method of immunizing an individual against infection by vaccinia and/or variola virus by inducing an immune response against a polypeptide comprising peptide 74A or 165, or its immunogenic fragments or mutants. The method is useful for immunizing an individual
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       against infection by vaccinia and/or variola virus. This sequence represents a vaccinia virus peptide used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Immunizing an individual against infection by vaccinia and/or variola virus comprises inducing an immune response against a polypeptide comprising peptide 74A or 165.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

nucleic acid molecules encoding such proteins. Sequences of the invention are useful as labelling tools for marking a protein, cell or organism in blochemistry, molecular biology and medical diagnostic applications. Chromoproteins are useful as colouring agents capable of imparting colour or pigment to a particular composition of matter, e.g. food compositions of paramaceuticals or cosmetics, as labels in analyte detection assays, or as selectable markers in recombinant DNA applications. Fluorescent applications, in high-throughput screening assays, as biosensors in prokaryotic and eukaryotic cells e.g. as calcium ion indicator, as phindicator or as phosphorylation indicator, as second messenger detectors, as in vivo markers in transgenic animals, or as fluorescent timers. The present sequence is Ricordea florida green fluorescent protein (ffloGFP)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates a recombinant DNA construct comprising a Dolynucleocide having any of 5544 nucleotide sequences (CDNAs SEQ ID NO: 1-5544) and encoding a polypeptide with any of 5544 amino acid sequences (SEQ ID NO: 5545-11088). The CDNAs and proteins are from corn, soybean, Arabidopsis, wheat and rape but the specification does not indicate which sequences is derived from which organism. Also included is a method of producing a plant having an improved property, comprising transforming a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New recombinant DNA constructs useful in the field of biochemistry and genetics, and in particular for producing transgenic plants with improved biological characteristics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   disease resistance, galactomannan production, plant growth regulator, heat tolerance, herbitoide tolerance, lighin production, extreme osmotic condition tolerance, pathogens resistance, pest resistance, pest resistance, yield improvement, seed oil yield, seed protein yield.
                   invention relates to novel chromo and/or fluorescent proteins and

                                                                                                                                                                                                                                                                                                                                       The invention relates to a method of immunizing an individual against infection by vaccinia and/or variola virus by inducing an immune response against a polypeptide comprising peptide 74A or 165, or its immunogenic fragments or mutants. The method is useful for immunizing an individual against infection by vaccinia and/or variola virus. This sequence represents a vaccinia virus peptide used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Chromoprotein; fluorescent protein; colouring agent; food composition; cosmetic; fluorescence resonance energy transfer; calcium ion indicator; biosensor; pH indicator; phosphorylation indicator; messenger detector; transgenic animal; fluorescent timer; green fluorescent protein; GFP;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   29-JUN-1999
             cc functional in a plant cell operably joined to a polymucleotide encoding a polymptopide associated with the property, and growing the transformed plant. The property is selected from improving plant cold tolerance, for manipulating growth rate in plant cells by modification of the cell cycle cathering plant disease, for improving plant drought tolerance, for providing increased resistance to plant disease, for galactomannan production, for production of improving plant tolerance, for improving plant tolerance to perheicides, for increasing the rate of improving plant tolerance to herbicides, for increasing the rate of college to pathogens or pests, for lighin production, for improving plant tolerance to extreme osmotic conditions, for improving plant tolerance to pathogens or pests, for yield improvement by modification of carbohydrate, introgen or phosphorus use and/or uptake and for yield improvement by providing improved plant growth and development under at least one stress condition. The polymucleotide may also encode a plant transcription factor. The methods and compositions of the present invention are useful in the field of biochemistry and composition are useful in the field of biochemistry and the present invention are useful in the field of biochemistry and compositions are plant plant tolerance to cold or heat, improved introgen flow, increasing plant tolerance to cold or heat, improved introgen cold malysis systems. The present sequence is one of the S34 plant protein are useful markers, computer-based storage and analysis systems. The present sequence is one of the S34 plant protein sequences of the invention. Note: The sequence data for this patent did composition to sequences of the invention. Note: The sequence data for this patent did composition of sequences of the invention. Note: The sequence of the printed s

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:
(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Antisense; prokaryotic essential gene; cell proliferation; drug design.

                                                                                                                                                   The invention describes a new isolated nucleic acid encoding a Klebsiella pneumoniae polypeptide. Also described are: a recombinant expression vector comprising the nucleic acid, operably linked to a transcription regulatory element, and a cell comprising the recombinant expression vector. The nucleic acid is useful for preparing a vaccine composition against Klebsiella pneumoniae. This is the amino acid sequence of a Klebsiella pneumoniae polypeptide of the invention
                                                       New nucleic acid encoding a Klebsiella pneumoniae polypeptide, useful for preparing a vaccine composition against Klebsiella pneumoniae.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are: (1) a vector comprising a promoter operably linked to the nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Antisense; prokaryotic essential gene; cell proliferation; drug design.

New genome of Legionella pneumophila Paris strain and derived

```
ö
                                                                                                            from Legionella pneumophila Paris strain. (I), and their related as gequences or fragments, are useful as primers and probes for detection and amplification, including differentiation between the Paris and Philadelphia strains of Legionella pneumophila and to prepare recombinant (hybrid) polypeptides (II). (II) are also useful for preparation of specific antibodies (Ab), also used for detection/identification of Legionella, and some (I), specifically those involved in synthesis of surface proteins, are targets for identification of inhibitors. (II), or eccorns that contain (I), are useful as vaccines and immunogenic compositions, for treatment and prevention of infections by L. present squence represents the amino acid sequence of a
                                                                                                 The invention relates to an isolated or purified nucleotide sequences (I)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Also disclosed are the nucleic acid molecules encoding the proteins and antibodies that specifically bind to the proteins. The composition comprising the protein, nucleic acid or antibody is useful for the manufacture of a medicament for treating or preventing N. gonorrhoeae infection, this may be in the form of a vaccine or gene therapy. Sequences given in records ABP76736-ABP81046 represent nucleic acid molecules of the invention
polypeptides, useful for detection or identification of the strain and for treatment and prevention of infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           protein from Neisseria gonorrheae, useful for the manufacture of a cament for treating or preventing N. gonorrheae infection.
                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to proteins from Neisseria gonorrhoeae

identifying proteins or screening for homologous nucleic acids required dro cellular proliferation to isolate candidate molecules for rational droy discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained it electronic format directly from WIPO at first publypublished_pct_sequences. (Updated on 23-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:
(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Antisense; prokaryotic essential gene; cell proliferation; drug design.

the gene product or that has an activity against a biological pathway required for proliferation, or that inhibits callular proliferation; (8) identifying a gene required for cellular proliferation or the biological pathway in which a proliferation required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an organism actes; (9) manufacturing an antibiotic; (10) profiling a compound, a activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent product is overexpressed or underexpressed; (12) determining the extent or collection of a trains; or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids are useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs, or for screening homologous nucleic acids contains a proliferation in cells other than Staurens, Staybimmrium, contains and services and services or surveys.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
proliferation; (7) identifying a compound that influences the activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Glaser P;

```

The invention relates to an isolated or purified nucleotide sequences (I)

```
ö
from Legionella pneumophila Paris strain. (I), and their related as equences or fragments, are useful as primers and probes for detection and amplification, including differentiation between the Paris and Philadelphia strains of Legionella pneumophila and to prepare recombinant (hybrid) polypeptides (II). (II) are also useful for preparation of Legionella, and some (I), specifically those involved in synthesis of surface proteins, are targets for identification of inhibitors. (II), ovectors that contain (I), are useful as vaccines and immunogenic compositions, for treatment and prevention of infections by L. pneumophila. The present squence represents the amino acid sequence of a L. pneumophila protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 antisense nucleic acids, useful for identifying proteins or screening homologous nucleic acids required for cellular proliferation to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are: (1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated antisense antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular

proliferation or the activity of a gene in an operon required for proliferation; (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway required for proliferation, or that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation or the biological pathway in which a proliferation-required gene or the product lies or a gene on which the test compound that inhibits proliferation of an compound s activity; (11) a culture comprising strains in which the gene or product is overexpressed or underexpressed; (12) determining the extent compound s activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent compound is overexpressed or underexpressed; (12) determining the extent compounds; or (13) identifying the targes of a compound that inhibits the compound that inhibits the proliferation of an organism. The autisense nucleic acids required for proliferation to isolate candidate molecules for rational cauged strains in cells other than S. aureus, S. typhimurium, K. Dienemioniae or P. aeruginsa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained for the universe of the termine of the printed specification, but was obtained for the termine of the te

The invention describes a recombinant DNA construct comprising a polynucleotide consisting of a sequence encoding an anino acid sequence available in electronic form from the US patent office at evallable in electronic form from the US patent office at the sequence.html?bocID:2004034088. The polynucleotide of the invention are also useful in physical arrays of molecules and as plant breeding markers. The recombinant DNA construct is useful for improving plant tolerance to cold, heat, drought, herbicides, extreme osmotic conditions, pathogens or pests, for manipulating growth rate in plant cells by modification of the cell cycle pathway, for conferring increased resistance to plant disease, for producing galactomannan, increased resistance to plant disease, for increaseing the rate of homologous recombination in plants, for improven plant growth and development under at least one photosynthesis or carbohydrate, nitrogen or phosphorus use and/or uptake or by providing improved plant growth and development under at least one tress condition or for modifying seed oil or protein yield and/or content. This is the amino acid sequence of a plant full length insert increase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                               New recombinant DNA construct, useful for improving plant tolerance to cold, heat, drought, herbicides, extreme osmotic conditions, pathogens or pests, for conferring increased resistance to plant disease, or for

```
E2Fa/DPa transcription factor of Arabidopsis and using these sequences to alter plant characteristics accordingly. The present invention describes generating transgenic plants for the production of growth regulators, conzymes, therapeutics, pharmaceuticals and animal feed products, where the altered plant characteristics are selected from increased yield or biomass, enhanced survival capacity, stress tolerance, plant architecture or physiology, altered endoreduplication, biochemistry, signal cransduction, storage lipid mobilisation and/or altered photosynthesis, each relative to the corresponding wild type plants. Accordingly, these sequences can also be useful as positive or negative selectable markers during transformation of cells or tissues. The identified genes play a role in a variety of biological processes such as DNA replication, cell or tissues and/or across matching transformation and/or acrobon metabolism or they function as transcription factors. This polypeptide sequence is thale cress protein expressed by a gene upregulated 1.3 fold or more in plants overexpressing the entire or application of the elements.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Protein identification, signal transduction pathway, metabolic pathway, hybridisation assay, genetic mapping, gene expression control, promoter;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to identifying target proteins (ABB90790-ABB94016) for herbicidally active compounds, comprising aligning and comparing nucleic acid or amino acid sequences from plant with nucleic acid or amino acid sequences from non-plant organisms using suitable search parameters, where plant sequences having an B-value greater by a factor of 3 than the B-value of most similar non-plant sequences are selected. The polypeptides or nucleic acids encoding them are useful for identifying modulators. The identified modulators are useful as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Identifying plant target proteins for herbicidally active compounds, comprising aligning and comparing nucleic acid or amino acid sequences from plant with nucleic acid or amino acid sequences from non-plant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                           Gaps

The present invention relates to polynucleotide sequences, and the proteins they encode. The sequences are isolated from a variety of proteins they encode. The sequences are isolated from a variety of caganisms such as plants (e.g. maize, rice, sorghum, thale cress, captum, thale cress, and wheat), cyanobacteria, bacteria, yeast and other fungi. The polynucleotide and polypeptide sequences of the invention are useful in the production of transpant plants that have improved properties. Also disclosed are methods of producing fertile transpent plants, preferably maize, with desired phenotypes. The polynucleotide and polypeptide sequences are useful for improving plants by providing protection against commotic stress, improving altering sugar transport and/or metabolism, modifying the cell cycle pathway, reducing plant height, modifying carbohydrate transport, improving crop productivity, improving plant carbohism, carbohydrate transport, improving crop productivity, improving plant carbohism, carbohydrate transport, improving dead resistance, improving cold or heat tolerance, improving nitrogen assimilation, improving stalk strength, improving biotic and abiotic stress resistance, improving resistance to oxidative stress providing increased vigour, reducing sensescence, and conferring virus resistance. The present sequence represents a polypeptide sequence of the invention. Note: The sequence data for this patent is not provided in the printed approach.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511), expressed DNA sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                       New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Recombinant DNA construct; transformed plant; improved plant property; cold tolerance; heat tolerance; drought tolerance; herbicide; osmosis; pathogen tolerance; pest tolerance; plant disease resistance; cell cycle pathway modification; plant growth regulator; homologous recombination; seed oil yield; protein yield; carbohydrate; nitrogen; phosphorus; photosynthesis; lignin; galactomannan; bacterial polypeptide.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell.cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins (ABB57737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a recombinant DNA construct comprising a promoter functional in a plant cell, where the promoter is positioned to promoter functional in a plant cell, where the promoter is positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source. The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a transformed plant such as maize or soybean. The method of producing a transformed plant having an improved property comprises transforming a plant with the recombinant DNA construct and growing the transformed plant, where the polynucleotide or polypeptide is useful for improving plant properties. The recombinant DNA construct is useful for improving plants with the recombinant DNA construct is useful for improving plants with colerance to herbicides, extreme osmotic conditions, pathogens or pests, increased resistance to plant disease, better growth rate by modification of the cell cycle pathway with plant growth regulators, increased rate of homologous recombination, modified seed oil or protein yield and/or content, improved plant growth and development under at least one stress condition, improved plant growth and development under at least one stress condition, improved lighting production or improved glactomannan
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                       New recombinant DNA construct comprising a promoter positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source, useful for producing plants with improved properties.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Cytostatic; antidiabetic; neuroprotective; cerebroprotective; ophthalmological; insulin; receptor; gene therapy; diabetes; insulin: IfF-1; tumour; prostate; breast; insulin-11ke growth factor-1; IGF-1; tumour; prostate; breast; diabetic retinopathy; neurological diseases; stroke; diabetic neuropathy.
                                                                                                                                                                                                                                                                                                                                                                                                                                       production. This sequence represents a bacterial polypeptide used in the scope of the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

The invention relates to a method of modulating insulin activity in mammalian cells by administering a peptide that binds the insulin receptor (TR). A composition containing a peptide, optionally expressed from gene therapy vectors, that binds to Site I of IR and an insulin agonist are useful for treating diabetes. Also, peptides that are useful for treating diabetes. Also, peptides that are useful for treating insulin-like growth factor-1 (IGF-1) receptor are useful for treating insulin-like growth factor (IGF)-sensitive tumours (e.g. of prostate and breast) and diabetic retinopathy, while IGF-1 receptor agonists are useful for treating neurological diseases, including stroke and diabetic neuropathy. The peptides are also useful in screening for compounds that bind to IR or IGF-1 receptor, potential therapeutics and research reagents. AAU88034-AAU90957 represent IR and/or IGF-1 receptor-binding peptides and related amino acid sequences of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             insulin-like growth factor receptor; IGFR; modulate; insulin receptor; IR; insulin; cytostatic; IGFR agonist; IGFR antagonist; cancer; leukaemia; sarcoma; lymphoma; carcinoma.

The growth factor receptor (IGRR) activity in insulin-like growth factor receptor (IGRR) activity in insulin-like growth factor receptor (IGRR) activity in insulin-like growth factor receptor (IGRR) activity of IGRR. In modulating IGRR activity, the amino acid sequence comprises XXZXXXXXX (I), where XI, XZ and XS = phenylalanine or tyrosine; X3 = asparit acid, glutamic acid, glycine or serine; and X4 = tryptophan, tyrosine or phenylalanine. The amino acid sequence is not insulin, insulin-like growth receptor antibody, an anti-insulin-like growth receptor antibody, or its fragment. Also described: (1) decreasing or increasing IGRR activity in IGR-responsive mammalian cells by contacting the cells with an amino acid sequence to decrease or increase the activity of IGRR; (2) an IGRR modulator, agonist or antagonist; (3) identifying IGRR modulator; and (4) enhancing survival of an IGR-responsive mammalian cell by contacting the cell with (I) to enhance the survival of the cell. IGRR modulators have cytostatic activity, and can be used as IGRR agonists are carcinoma. The methods, modulators, agonists and antagonists are carcinoma. The methods are useful for identifying molecular structures that are capable of acting as an IGRR agonist. The present invarior represents a peptide given in the exemplification of the present invarior.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
responsive mammalian cells, useful for treating cancer comprises contacting the cells with an amino acid sequence to modulate the activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     insulin receptor; insulin; insulin-like growth factor receptor; agonist; antagonist; antidiabetic; diabetes; insulin shock.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Modulating insulin-like growth factor receptor (IGFR) activity in IGF-responsive mammalian cells, useful for treating diabetes comprises

                                                                     The invention relates to a novel method for decreasing or increasing insulin receptor activity in mammalian cells. The invention further relates to peptide sequences capable of binding to insulin and/or insulin-like growth factor receptors with either agonist or antagonist activity. The peptide sequences are identified from various peptide libraries. The novel method comprises administering to the mammalian cells an amino acid having subsequences that binds to site 1 and site 2 of an insulin receptor. The subsequences are joined C-terminus to N-terminus and oriented site 1 to site 2. The sequence is not insulin or insulin-like growth factor. The peptides sequences of the invention have antidiabetic activity. The peptides are useful for treating diabetes or insulin shock. This sequence represents an insulin receptor/ insulin growth factor receptor binding polypeptide relating to the invention.
contacting the cells with an amino acid sequence to modulate the activity
                                                                                                                                                                                                                                                                                                                                                           Gaps

The invention relates to a method of decreasing insulin receptor activity in mammalian cells which comprises administering an amino acid sequence having a subsequence comprising a sequence that binds to Site 1 and Site 2 of insulin receptor, where the subsequences are linked C-terminus to N-terminus and oriented Site 1 to Site 2, where the amino acid sequence is not insulin, insulin-like growth factor or their fragments. The methods and compositions of the present invention are useful for treating insulin-or insulin-like growth factor-related diseases or conditions, such as diabetes and insulin shock. The present sequence is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      insulin-like growth factor receptor; IGFR; modulate; insulin receptor;
                                                                                                                                                                                                                                                                               Decreasing or increasing insulin receptor activity in mammalian cells using peptide sequences that bind insulin and/or insulin-like growth factor receptors, useful for treating diabetes and insulin shock.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         IR; insulin; cytostatic; IGFR agonist; IGFR antagonist; cancer; leukaemia; sarcoma; lymphoma; carcinoma.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                요
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    peptides for modulating, increasing or decreasing insulin-like growth factor receptor activity in insulin-like growth factor receptor adminingly an insulin-like growth factor receptor adminingly in insulin-like growth factor receptor adminingly insulin-like growth factor receptor modulator; and enhanding survival of an insulin-like growth factor receptor activity in insulin-like growth factor receptors activity in insulin-like growth factor receptors activity in insulin-like growth factor receptors activity in ansulin-like growth for binding to insulin and and activity. As agonists, the peptides are useful for development of therapeutics to supplement or replace endogenous peptide hormones. The gradulating other more potent or selective therapeutics, assay reagents for identifying other more potent or selective therapeutics, assay reagents of analysis of IR and IGF-IR. The IGF-IR antagonists are useful as treatment for cancer, e.g. breast, prostate, colorectal or ovarian cancer. This is the amino acid sequence of a IGF-IR/IR binding peptide obtained by the receptor (IGF-IR) and insulin receptor (IR). Note: This sequence is also available in electronic format from the US patent office at the sequence is also available in electronic format from the US patent office at

The present invention describes a method for modulating insulin-like growth factor receptor (IGFR) activity in insulin-like growth factor-c growth factor receptor (IGFR) activity in insulin-like growth factor-c growth factor reagonative mammalian cells comprising contacting the cells with an amino acid sequence to modulate the activity of IGFR. In modulating IGFR activity, the amino acid sequence comprises XIXZXXXXXX (I), where XI, XZ and XS = phenylalanine or tyrosine or phenylalanine. The growth factor, an anti-cipaline or phenylalanine. The amino acid sequence is not insulin, insulin-like growth factor, an anti-cipaline in receptor antibody, an anti-insulin-like growth faceptor antibody, or its fragment. Also described: (I) decreasing or increased in IGF-responsive mammalian cells by contacting the cells with an amino acid sequence to decrease or increase the activity of IGFR; (2) an IGFR modulator, agonist or antagonist; (3) identifying IGFR modulator; and (4) enhancing survival of an IGF-responsive mammalian cell by contacting the cell with (I) to enhance the survival of the cell. IGFR modulators have cytostatic activity, and can be used as IGFR agonists or IGFR antagonists. The methods, modulators, agonists and antagonists are contacting the cell with (I) to enhance is accome, lymphoma or carcinoma. The methods are useful for identifying molecular structures that are capable of acting as an IGFR agonist or antagonist. The present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
Modulating insulin-like growth factor receptor (IGFR) activity in IGF-responsive mammalian cells, useful for treating cancer comprises contexting the cells with an amino acid sequence to modulate the activity of IGFR.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      insulin receptor; insulin; insulin-like growth factor receptor; agonist; antagonist; antidiabetic; diabetes; insulin shock.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Modulating insulin-like growth factor receptor (IGFR) activity in IGF-

                                                                                        The invention relates to a novel method for decreasing or increasing insulin receptor activity in mammalian cells. The invention further relates to peptide sequences capable of binding to insulin and/or insulin-like growth factor receptors with either agonist or antagonist activity. The peptide sequences are identified from various peptide libraries. The novel method comprises administering to the mammalian cells an amino acid having subsequences that binds to site 1 and site 2 of an insulin receptor. The subsequences are joined C-terminus to N-terminus and oriented site 1 to site 2. The sequence is not insulin or insulin-like growth factor. The peptide sequences of the invention have antidiabetic activity. The peptides are useful for treating diabetes or insulin shock. This sequence represents an insulin receptor/ insulin growth factor receptor binding polypeptide relating to the invention.
responsive mammalian cells, useful for treating diabetes comprises contacting the cells with an amino acid sequence to modulate the activity
                                                                                                                                                                                                                                                                                                                                                                                  Gaps

The methods and compositions of the present invention are useful for treating insulin-or insulin-like growth factor-related diseases or conditions, such as diabetes and insulin shock. The present sequence is used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New human genome-derived single exon nucleic acid probes useful for human
                                                                                                                                                                                                                                                   Decreasing or increasing insulin receptor activity in mammalian cells using peptide sequences that bind insulin and/or insulin-like growth factor receptors, useful for treating diabetes and insulin shock.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    .;

```
The invention relates to a nucleic acid probe for measuring human gene expression, comprising any of the 27,400 fully defined nucleotide sequences of sequences in the specification, or their complements or fragments, and encoding at least 8 amino acids of any of the 6888 amino acid sequences fully defined in the specification. The probe is a single exon probe that hybridises under high stringency conditions to a nucleic acid molecule expressed in human cells or tissues. Also included are a spatially-datressed in human cells or tissues. Also included are a spatially-datressed in human cells or tissues. Also included are a spatially-depressed in human cells or tissues. Also included are a spatially-defereably isolately exon nucleic acid molecule expression (comprising a plurality of gingle exon nucleic acid adversable or amplifitable from the plurality, a single of any office acid or comprising the single exon and addressably theolately man gene expression, a method of exon microarray for measuring human gene expression, a vector comprising at least 8 contiguous amino acids of any of the above-mentioned amino acid sequences (optionally with conservative amino acid substitutions), an configuous amino acid and/or licensing single exon probes or microarrays to isolated antibody that blunds specifically to a peptide cited above. The probe measure gene expression a single exon probes or microarrays to including data on the expression of a single exon probe cited above. The probes may be used as tools for surveying thuman gene expression data by subscription, and a computer-readable (each record including data on the expression of a single exon probe cited above. The probes may be used as tools for surveying tissues to detect the probes may be used as tools for surveying tissues to detect the probes and apparatus are useful in gene expression analysis. The probes may be used as tools for surveying alterative splicing events, in detecting and characterising gross alterations in the genomic locus that includes their exon
gene expression analysis, for identifying or characterizing alternative splicing events, for assessing genomic alterations or as tools for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               SAPHO syndrome; synovitis; acne; pustulosis; hypertosis; osteomyelitis; uveitis; endopthalmitis; bone; joint; central nervous system; ELISA; inflammatory lesion; acne vulgaris; enryme linked immunosorbent assay; dermatological; osteopathic; neuroprotectent.

Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by C. P. acnes. The disorders include SAPHO syndrome (synovitis, acne, pustulosis, hypertosis and costeonyalitis), uveitis and endophthalmitis. C. P. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgarits. A method for detecting the CC presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies contacting the captering and activity of P. acnes polypeptides and commerced to acnes infections. The antibodies may also be used as contacting the antibodies may also be used as chargened in the production of antibodies of contacting the antibodies may also be used as contacting the antibodies may also be used as contactions. The antibodies may also be used as chargened in the production of contampart of the printed specification, but was contacting the contaction of contained in electronic format directly from WIPO at

                                                                                                                                                                                                                                                                           The invention relates to an isolated polymuclectide (ACF64435-ACF64733)
encoding a Propionibacterium acnes protein. The invention also relates to
encoding a Propionibacterium acnes protein. The invention also relates to
companie a probymuclectides. The invention
additionally encompasses expression vectors and host cells comprising a
companie of the invention, antibodies against polypeptides of the
invention, fusion proteins comprising a polypeptide of the invention; a
composition immune response specific for a P. acnes
invention, fusion proteins comprising a polypeptide of the invention; a
composition of comprising P. acnes polypeptides,
composition (comprising P. acnes polypeptides,
composition (comprising P. acnes polypeptides,
composition proteins, T cell populations, or
composition or determining the presence or absence of P. acnes in a
composition or determining the presence or absence of P. acnes in a
composition or determining the presence or absence of P. acnes in a
composition or antigen-presenting cells that express the
composition or antigen-presenting cells that express the
composition or antigen-presenting cells that express the
compositions, T cell populations or antigen-presenting cells that express the
compositions, or for stimulating an immune response specific for a P. acnes
composition of an immune response against P. acnes, or for treating acne
composition of an immune response against P. acnes, or for treating acne
composition of an immune response against P. acnes, or for treating accomposition frame) cand the kit is useful for performing a diagnostic assay. The present
composition of an immune response against P. acnes, or for treating accomposition frame) contained within the P. acnes polynucleotides of the
contained specification, but was obtained in electronic format directly
contained specification, but was obtained in electroni
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                       New Propionibacterium acnes polypeptides and polynucleotides encoding the polypeptide, useful for diagnosing, preventing or treating acne vulgaris, or for stimulating an immune response specific for a P. acnes protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     sesquiterpene synthase; cubebol synthase; GFTbsC; transformed plant cell;

```
This sequence represents a peptide fragment from a sesquiterpene synthase, around residues 280-355. This peptide fragment was used in the production of degenerate primers for the isolation of sesquiterpene synthase coding sequences from grapefruit. The isolated sequences may be used in the production of sesquiterpene synthases by culturing a transformed plant cell in conditions conducive to the production of a sesquiterpene synthase of the invention are useful for converting farnesyl-pyrophosphate to various oxygenated and aliphatic sesquiterpenes, including valencene, bicyclo-germacrene, cubebol, delta-cadine. Sesquiterpene compounds are used in perfumery. A plant-independent system of production of sesquiterpene compounds would be of interest, to remove the price link to plant availability.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New sesquiterpene synthase, useful for converting famesyl-pyrophosphate to various oxygenated and aliphatic sesquiterpenes including valencene, bicyclogermacrene, cubebol, and delta-cadine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

sesquiterpene synthase; cubebol synthase; GFTbsC; transformed plant cell;
farnesyl-pyrophosphate; valencene; bicyclo-germacrene; cubebol;
delta-cadine; perfumery; GFTpsA; GFTpsB; GFTpsD1; GFTpsB2; GFTpsB.
aliphatic sesquiterpenes, including valencene, bicyclo-germacrene, cubebol, delta-cadine. Sesquiterpene compounds are used in perfumery. A plant-independent system of production of sesquiterpene compounds would be of interest, to remove the price link to plant availability.

This peptide fragment was used in the production of degenerate primers for the isolation of sesquiterpene synthase coding sequences from grapefruit. The isolated sequences may be used in the production of sesquiterpene synthases by culturing a transformed plant cell in conditions conductive to the production of a sesquiterpene synthases of the invention of a sesquiterpene synthases of the invention are useful for converting farnesyl-pyrophosphate to various oxygenated and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New sesquiterpene synthase, useful for converting famesyl-pyrophosphate to various oxygenated and aliphatic sesquiterpenes including valencene, bicyclogermacrene, cubebol, and delta-cadine.

New nucleic acid encoding a patchoulol synthase or gamma-curcumene synthase or a polypeptide having sesquiterpene synthase activity, useful for making terpenoids used in perfumery, cosmetics and medicine.
                                         The present invention relates to patchoulol synthase, gamma-curcumene synthase and sesquiterpene synthase polypeptides and their encoding polymucleotides. The invention is useful for making terpenoids used in perfumery, cosmetics and medicine. The present sequence is the tobacco epi-aristolochene synthase protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to patchoulol synthase, gamma-curcumene synthase and sesquiterspene synthase polypoptides and their encoding polymucleotides.                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                       This sequence represents a peptide fragment from a sesquiterpene synthase, around residues 280-355. This peptide fragment was used in the production of degenerate primers for the isolation of sesquiterpene synthase coding sequences from grapefruit. The isolated sequences may be used in the production of sesquiterpene synthases by culturing a transformed plant cell in conditions conductive to the production of a sesquiterpene synthase. The sesquiterpene synthases of the invention are useful for converting farmesyl-pyrophosphate to various oxygenated and alighbatic sesquiterpenes, including valenceme, bicyclo-germacrene, cubebol, delta-cadine. Sesquiterpene compounds are used in perfumery. A plant-independent system of production of sesquiterpene compounds would be of interest, to remove the price link to plant availability.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New nucleic acid encoding a patchoulol synthase or gamma-curcumene synthase or a polypeptide having sesquiterpene synthase activity, useful for making terpenoids used in perfumery, cosmetics and medicine.
                                       New sesquiterpene synthase, useful for converting famesyl-pyrophosphate to various oxygenated and aliphatic sesquiterpenes including valencene, bicyclogermacrene, cubebol, and delta-cadine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to patchoulol synthase, gamma-curcumene synthase and sesquiterpene synthase polypeptides and their encoding polymucleotides. The invention is useful for making terpenoids used in perfumery, cosmetics and medicine. The present sequence is the Hyoscyamus
                                                                                                                                                                                                                                                                                                                                     New nucleic acid encoding a patchoulol synthase or gamma-curcumene synthase or a polypeptide having sesquiterpene synthase activity, useful for making terpenoids used in perfumery, cosmetics and medicine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

The invention relates to an isolated antifungal ribosomal protein from fusarium culmorum, FCWP1. Also included is a fusion protein between the signal peptide of the antifungal protein AlyAPE from AlySesum and FCWP1, encoded by the nucleic acid appearing as ADC87758. The FCWP1 proteins are useful for controlling fungal infections in plante, such as those caused by Alternaria (e.g. Alternaria brasalcola, Alternaria solani), ascorbyta (e.g. Alternaria brasalcola, Alternaria solani), carcospora (e.g. Alternaria brasalcola, Alternaria solani), carcospora (e.g. Alternaria prasalcola, Alternaria solani), protein controlling fungal infections in plante, such as those caused by Alternaria (e.g. Alternaria brasalcola, Alternaria solani), carcospora (e.g. Accospora Kikuchii, Cercospora Zeaa-maydis), Collectrichum (e.g. Pusarium velem), planten collectrichum (e.g. Pusarium roseum), Plantinchosporium avacobnum, Helminthosporium acatorum, Phycophthora carbonum, Helminthosporium acatorum, Phycophthora phaseolila figiensis), Noctria (e.g. Mycosphaerella figiensis), Noctria (e.g. Mycosphaerella figiensis), Noctria (e.g. Mycophherea (e.g. Phycophthora megasperma (e.g. Phycophthora phaseoli, Phytophthora parasitica, Phytophthora citrophthora, Phytophthora megasperma (e.g. Phytophthora phaseoli, Phytophthora parasitica, Phytophthora citrophthora, Phytophthora megasperma (e.g. Phytophthora phaseoli, Phytophthora megasperma (e.g. Phytophthora phaseoli, Phytophthora avacorum, Phytophthora megasperma (e.g. Pytophthora megasperma (e.g. Pytotularia (e.g. Pytoularia arachidis), Phythum (e.g. Pythium (e.g. Pythium (e.g. Pythium (e.g. Pythium (e.g. Pythium (e.g. Septoria)), Alternaria avacobla (e.g
                               plant fungal infection, Alternaria, Ascochyta, Botrytis, Cercospora, Colletotrichum, Diplodia, Fusarium, Gaeumanomyces, Helminthosporium, Macrophomina, Wycosphaerealla, Nectrás, Perconospora, Phoma, Phyrophthora, Plasmopara, Podosphaera, Puccinia, Puthium, Pyrenophora, Pyricularia, Pythium, Rhizoctonia, Scerotium, Sclerotinia, Septoria, Thielaviopsis, Venturia, Verticillium.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel antifungal protein FCWP1, isolated from Fusarium culmorum, useful

                                                                                                                                                                                                                                                                                                                                                                                                                                셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to an isolated antifungal ribosomal protein from
fusarium culmorum, FCWP1. Also included is a fusion protein between the
signal peptide of the antifungal protein AlyAFP from Alyasum and FCWP1,
encoded by the nucleic acid appearing as ADC87758. The FCWP1 proteins are
cuseful for controlling fungal infections in plants, such as those caused
by Alternaria (e.g. Ascochyta piss); Botrytis (e.g. Botrytis cinerea ),
Cercospora (e.g. Ascochyta piss); Botrytis (e.g. Botrytis cinerea ),
Cercospora (e.g. Cercospora kikuchii, Cercospora zaea-maydis),
COlletotrichum (e.g. Colletotrichum lindemuthianum ), Diplodia (e.g.
Diplodia maydis); Pusarium (e.g. Fusarium solani, Fusarium
C Buarium graminearum, Fusarium culmorum, Fusarium solani, Fusarium
C Buarium graminearum, Halminthosporium (e.g. Helminthosporium turcicum
C, Helminthosporium carbonum, Helminthosporium maydis ), Macrophomina
C (e.g. Macrophomina phaseolina, Maganaporthe grisea ), Mycosphaerella
CC (e.g. Macrophomina figiensis), Nectria (Nectria heamatcococca),
C Peronospora (e.g. Peronospora manshurica, Peronospora tabacina), Phoma
C (e.g. Phoma betae), Phymacotrichum (e.g. Phymatotrichum omnivorum),
C Phytophthora (e.g. Phytophthora cinnamomi, Phytophthora cactorum)
                                                                                              ö

The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed consistent of in diagnostics as expressed sequence tags for identifying expressed consistent of the consistent of the consistent of activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders of supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders of involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in cidagencies, forensics, gene mapping, identification of mutations capponsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and cannon acid sequences. ABG0010-ABG30377 represent novel human diagnostic manno acid sequences of the invention. Note: The sequence data for this content did not appear in the printed specification, but was obtained in citywipo.int/pub/published_pct_sequences

The invention describes a recombinant DNA construct comprising a polynucleotide consisting of a sequence encoding an amino acid sequence available in electronic form from the US patent office at the available in electronic form from the US patent office at the sequence. The sequence. The US patent of Sequence. The Tecombinant DNA construct is useful for plant breeding markers. The recombinant DNA construct is useful for improving plant tolerance to cold, heat, drought, heathicides, extreme osmotic conditions, pathogens or pests, for manipulating growth rate in plant cells by modification of the cell cycle pathway, for conferring increased resistance to plant disease, for producing galactomannan, conceased resistance in plant disease, for increased resistance to plant disease, for increasing the rate of homologous recombination in plants, for improving yield by modification of photosynthesis or carbohydrate, nitrogen or phosphorus use and/or uptake or by providing improved plant growth and development under at least one stress condition or for modifying seed oil or protein yield and/or content. This is the amino acid sequence of a plant full length insert in the recombinant DNA construct of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

AAW13921-W13928 represent the sequences for the heavy and light chains of the human monoclonal antibodies of the invention. The antibody of the invention preferably contains the sequence represented by AAW13912 in the complementarity determining region-1 (CPR-1) of the heavy chain variable region. The antibody of the invention also contains the sequence represented by AAW13913 in the CDR-3 of the light chain variable region. The antibody is capable of binding to adr type hepatitis B (HB) virus antigen. A human anti-HB virus monoclonal antibody preparation which is highly safe and is effective to adr type HB virus can be provided, using the monoclonal antibody. It can also be used as a vaccine against HB
                                                                                                                                                                                                                                                                                                                                                                                                                                Antibody; heavy chain; light chain; variable region; human; monoclonal; complementarity determining region; human; adr type hepatitis B virus; HB virus; CDR; virus antigen; anti-HB antibody; vaccine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human anti-Hepatitis B antibody - used in a adr type HB virus vaccine.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to novel human cDNAs (AEC84246-AEC86688) encoding proteins AEC86689-AEC89131. The cDNAs are useful for analyzing the functions of the proteins, and for developing medicines for diseases e.g. osteoporosis, cancer, inflammation, gastritis, or gastroduodenal ulcer. Note: The sequence data for this parent did not form part of the printed specification but was obtained in electronic format directly from
                                         The invention relates to a novel human polynucleotide and the encoded bolygeptide. A polynucleotide of the invention may have a use in gene therapy. An oligonucleotide of the invention ADM06202-ADM06773 is useful as a primer for synthesizing the polynucleotide or as a probe for useful in gene therapy, for developing a diagnostic marker or medicines for regulating the polynucleotide The polynucleotides ADM01316-ADM03758 are useful in gene therapy, for developing a diagnostic marker or medicines for regulating their expression and activity, or as a target of gene therapy. The proteins ADM03759-ADM06201 encoded by the polynucleotides are useful as pharmaceutical agents. The present sequence represents a protein sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Osteopathic, Cytostatic, Antiinflammatory, Gastrointestinal-Gen.; Antiulcer, Gene Therapy, Osteoporosis, cancer; inflammation, gastritis; stomach ulcer, gastrointestinal ulcer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New full-length cDNA sequences, useful for treating diseases, e.g. osteoporosis, cancer, inflammation, gastritis, or gastroduodenal ulcer.
                                                                                                                                                                                                                                                                                                                                                                                        Gaps

RP-1 WH domains (AAW11634-37) of human monoclonal antibodies (hWAbs) RF-1 and RF-2, which show high affinity for respiratory syncytial virus (RSV) and RF-2, which show high affinity for respiratory syncytial virus (RSV) splenocytes in vitro; transferral of primed splenocytes to a SCID mouse; boosting with antigen; isolating human antibody-producing B-cells from boosting with antigen; isolating human antibody-producing B-cells from virus. DNA (see also AAT6128-39) encoding the RF-1 and RF-2 heavy and light variable domains can be incorporated into vectors (e.g. NEOSPLA) and used to transfect eukaryotic (e.g. CHO) cells (see also AAW11638-41) to provide a constant, stable supply of anti-RSV F-protein hWABs for use in the treatment or prevention of RSV infection. (N.B. Fig 7b is referred to as the RF-1 VH domain in the specification, but is identical to the RF
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human monoclonal antibody specific for respiratory syncytial virus fusion protein - used for the prevention and treatment of RSV infection.

The invention describes an isolated DNA molecule encoding a fusion protein consisting of 4 different functional domains selected from glucan association domain (GLASS), linker domain (LINRS), glucosyl transferase domain (GLATR), and C-terminal end (CTEND) which are operably linked to come another. The DNA molecule is useful for expressing in plants polypeptides including starch synthase enzymes as fusion proteins with improved affinity to starch and modified catalytic capabilities and to the in vivo and in vitro synthesis of glucan chains of modified lengths as compared to plants producing native starch produced with cative starch synthases. Expression of the starch synthase fusion proteins along with granule bound starch synthase (GBSS) will lead to a modified starch having an altered or improved morphology, terrogradation, waterbinding, or swelling potential of the granules, gel strength dhesiveness, cohesiveness, hardness, elasticity, increased or decreased companion and increased or decreased glucan chain lengths. This is the amino acid sequence of a starch synthase functional domain associated
                                                                                                                                                                                                                                                                    Starch; starch synthase; glucan association domain; GLASS; linker domain;

Apis cerana phospholipase A2 protein.
             10-DEC-2002 (first entry)
  The invention relates to a composition comprising an isolated human antibody or its fragment or other variant, where the antibody, the fragment or the other variant specifically binds to an asparty!

(asparaginyl) beta-hydroxylase (AAH). The invention also relates to an isolated nucleic acid molecule comprising a sequence encoding a human cisolated nucleic acid molecule comprising a sequence encoding a human critically binds to human AAH (HAAH), an expression vector comprising the nucleic acid molecule, a host cell comprising the expression vector, a method of modulating an AAH activity in a cell, a method of treating a patient who has a cancer associated with overactive or over expressed AAH, a method for identifying an antibody or its fragment or other variant that specifically binds to an AAH and method of making a human monoclonal antibody or its fragment or other variant that specifically binds to an AAH. The composition, antibody, nucleic acid, kit and methods are useful for diagnosing or treating cancer, where the cancer cell is a tumor cell of the lung, liver, colon, pancreas, prostate, ovary, bile duct, brain or breast. This sequence represents an anti-HAAH antibody variable region used in the scope of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

This invention relates to a novel ordered and repetitive antigen array used in the production of vaccines for infectious diseases. The invention also discloses a composition comprising a non-natural molecular scaffold comprising a core particle selected from a core particle of a non-natural comprising a core particle of natural origin and an organiser comprising at least one first attachment site, where the organiser is connected to the core particle by at least one covalent bond. Also disclosed is an antigen or antigenic determinant with at least one second attachment is antigen or antigenic determinant with at least one second attachment (Abetal-42) or its fragment and where the second attachment site is selected from an attachment site not naturally occurring with the antigen or antigenic determinant, where the second attachment site is selected from an attachment site not naturally occurring with the antigen or antigenic determinant, where the second attachment site is capable of association through at least one non-peptide bond to the first attachment site and where the antigen or antigenic determinant and the scaffold interact through the association to form an ordered and capable of forming a capsid which comprises mutant obeta coat proteins capable of forming a capsid which comprises mutant obeta coat proteins thilly defined in the specification. The compounds of the invention may capital with the second stream of the invention may the compounds of the invention may the compounds of the invention may
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Molecular antigen array used in the production of vaccines for infectious
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          have antimicrobial, antiallergic, immunomodulatory, cytostatic, antiviral, antidiabetic, or hypoglycaemic activities and may be used in immunisation and as a vaccine. The present sequence represents a protein sequence used to create the compositions of the invention

```
The invention discloses a composition comprising two or more isolated rat or human polymuclectides or a polymucleotide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the novel polymucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a kit to perform the method, an array, a method for identifying an agent that increases or decreases the expression of the polymucleotide sequence that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the expression of a polymucleotide sequence which is differentially expressed in an animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the polymucleotides, a method for producing a pharmaceutical composition, a
                                    gravis, immunoproliferative disease lymphadenopathy, and and solutions of arthritis, diabetes, multiple sclerosis, Alzheimer's disease, osteoporosis and infectious diseases. The present sequence is an antigen for use in the array of the invention. The antigen is modified to posses a cleavage site (enterowinase or factor Xs) and a Cysteiner containing North Cereminal linker peptide which serves as the attachment point to a virus like particle or bacterial protein (the scaffold protein)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Rat; pain; neuronal tissue; gene therapy; spinal segmental nerve injury; chronic constriction injury; CCI; spared nerve injury; SNI; Chung.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New composition comprising two or more isolated polypeptides, useful for preparing a medicament for treating pain in an animal.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a composition comprising: (a) a non-natural molecular scaffold comprising: (i) a core particle selected from: (1) a core particle of a non-natural origin; and (2) a core particle of natural origin; and (ii) an organiser comprising at least one first attachment site, where the organiser is connected to the core particle by at least one covalent bond; (b) an antigen or antigenic determinant with at least one scoond attachment site, where the antigen or antigenic determinant is amyloid beta peptide (Abeta 1-42) or its fragment, and where the second attachment site is selected from: (i) an attachment site naturally occurring with the antigen or antigenic determinant, where the second attachment site is capable of association cattachment site attachment site account attachment site is capable of association through at least one non-peptide bond to the first attachment site; and where the antigen or antigenic determinant and the scaffold interact converted and repetitive antigen array. The composition is used in converted and repetitive antigen array. The composition is used in the immunisation and as a vaccine for diseases such as influenza, graft or immunisation and as a vaccine for diseases such as influenza, graft respiratory distress syndrome (ARDS), Crohn's disease, allergic asthma, acute lymphoblastic leukaemia, non-Hodgkin's lymphoma, Grave's disease,
                                                                                                                                                                                                               Molecular antigen array; vaccine; antigen; antimicrobial; molecular scaffold; amyloid beta; Abeta 1-42; influenza; graft versus host disease; IgE-mediated allergic reaction; anaphylaxis; adult respiratory distress syndrome; ARDS; Crohn's disease; allergic asthma; acute lymphoblastic leukaemia; non-Hodgkin's lymphoma; Grave's disease; systemic lupus erythematosus; osteoporosis; inflammatory immune disease; myasthenia gravis; multiple sclerosis; immunoproliferative disease lymphadenopathy; Alzheimer's disease; angioimmunoproliferative lymphadenopathy; immunoblastive lymphadenopathy; rheumicid arthritis; diabetes; inflectious disease; factor Xa;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Molecular antigen array used in the production of vaccines for infectious
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Frey
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Staufenbiel M,

ö
method for identifying a compound or small molecule that regulates the activity in an animal of one or more of the polypeptides given in the specification, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more polypeptides or their antibodies. The polymucleotide or the compound that modulates its activity is useful for preparing a medicament for treating pain (e.g. spinal segmental nerve injury (Chung), chronic constriction injury (CCI) and spared nerve injury (SNI)) in an animal (e.g. gene therapy). The sequence presented is a rat protein (shown in Table 2 of the specification) which is differentially expressed during pain. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic form directly from WIPO at

                                                                                                                                    The invention relates to novel isolated nucleic acid molecules encoding G protein-coupled receptors termed nGPCR-x. nGPCR-x polynucleotides, polypeptides, and mcdulators may be used in the treatment of diseases and conditions such as infections, such as viral infections caused by HIV-1 (human immunodeficiency virus) or HIV-2, pain, cancers, metabolic and cardiovascular diseases and disorders (e.g., type 2 diabetes, obesity, annexai, hypotension, hypertension, myocardial infarction, atherosclerosis), Parkinson's disease, and psychotic and neurological disorders, including schizophrenia, migraine, major depression, anxiety, mental disorder, manic depression, and dyskinesias, such as Huntington's disease or Tourette's Syndrome and many other diseases and syndromes listed in the specification. nGPCR-x polynucleotides and polypeptides, well as nGPCR-x modulators, may also be used in diagnostic assays for such diseases or conditions. The present sequence represents a G protein-
Isolated nucleic acid molecules encoding G protein-coupled receptors termed nGPCR-x, useful in the treatment and diagnosis of viral infections, cancers and mental disorders (e.g. Parkinson's disease and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Colon cancer associated gene sequences, referred to as colon cancer antigens, useful for the treatment, prevention, and diagnosis of colon disorders such as colon cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                identification, cytostatic; cardioactive; neuroprotective; vulnerary; immunomodulatory; muscular; gynaecological; gastrointestinal; nephrotropic, antiinfective; antibacterial; gene therapy; wound; neural disorder; immune system disorder; muscular disorder; reproductive disorder; gastrointestinal disorder; reproductive disorder; antionestinal disorder; renal disorder; infectious disease; cardiovascular disorder.

                                                                                                                                                                                                                                 셤
                        AAC97991 to AAC98763 encode the human colon cancer associated proteins, called human colon cancer antigens, given in AAB53234 to AAB54006. The human colon cancer antigens can have cytostatic, cardioactive, muscular; neuroprotective, immunomodulatory, gynaecological, gastrointestinal, vulnerary, nephrotropic, antiinfective and antibacterial activities, and can be used in gene therapy. The colon cancer antigen polymucleotides, proteins and antibodies to the proteins are useful for the prevention, treatment and diagnosis of colon disorders, such as colon cancer. The polymucleotides may be used in diagnostics and research, such as for chromosome identification, and as hybridisation probes. The proteins may also be used to prevent diseases such as neural disorders, immune system disorders, muscular disorders, reproductive disorders, immune system disorders, wounds, renal disorders, infectious diseases, and addisorders action and AAB54007 represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to an isolated polynucleotide encoding a phosphatidylethanolamine N-methyltransferase (BC 2.1.1.17) biosynthetic enzyme. The invention is useful in creating transgenic plants in which the polypeptides are present at higher or lower levels than normal cell types. The invention is also useful as probes for genetically and physically mapping the genes. The present sequence is corn phosphoethanolamine cytidyltransferase (BC 2.7.7.41) protein from clone cc71se-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Phosphatidylethanolamine N-methyltransferase; BC 2.1.1.17; transgenic; enzyme; transgenic plant; phosphoethanolamine cytidyltransferase; corn; BC 2.7.7.41.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New isolated polynucleotide encoding a phosphatidylethanolamine N-methyltransferase biosynthetic enzyme, useful for creating transgenic plants, as probes for genetic mapping or as a genetic marker.
                                                                                                                                                                                                                                                                                                                   Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Phosphatidylcholine biosynthesis; PC; protein synthesis; gene expression; herbicide; phosphoethanolamine cytidylyl transferase; corn; enzyme.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New phosphatidylcholine biosynthetic enzyme polypeptide, useful for studying protein synthesis in plants, for manipulating gene expression or for providing possible target for herbicides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to novel phosphatidylcholine (PC) blosynthetic enzymes and polymucleotides encoding such proteins. The nucleic acid sequences of the invention are useful for studying protein synthesis in plants, for manipulating gene expression or for providing possible target for herbicides. The present sequence is corn phosphochhanolamine cytidyly transferase, a phosphatidylcholine biosynthetic enzyme of the invention.
